It is encoded by a mutant SEA gene. The mutant gene product is unable to bind to the MHC on T-cells, and so is non-toxic. Mutant SEA and SEB genes were inserted into a Venezuelan equine encephalitis (VEB) replicon vector, to produce vaccine vectors. The mutant gene product is unable to bind to the MHC on T-cells, and so is non-toxic. Self-replicating RNA derived from the recombinant VEB vectors can be used as a nucleic acid vaccine, or to transfect cells along with RNA from helper plasmids. The

recombinant proteins produced are used as vaccines for providing immuni against Staphylococcal intoxication or as a diagnostic tool for detection of Staphylococcus excloxin. The transformed host cells are used to analyse the effectiveness of drugs and agents which inhibit S. aureus exotoxins or release of exotoxins. Infectious alpha-virus particles comprising the mutant SEA or SEB genes are used for providing immunity against Staphylococcal exotoxins by generating a protective immune reaction in humans or animals. The vaccines are used to reduce disease symptoms or reduce severity of disease caused by enterotoxins of S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 EKSEEINEKDLRKKSELQGTALGULKQIYYYNEKAKTENKESHDQFRQHTLFKGFFTDH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                      comprises 3 amino acid substitutions introduced into the SEA sequence:
1488, v89A and DOR. These mutations reduce the binding of the toxin to major histocompatibility complex (WHC) (1488 II and/or I cell receptors.
1488, v89A and DOR. These mutations reduce the binding of the toxin to major histocompatibility complex (WHC) (1488 II and/or I cell receptors.
15 The protein is expressed as a nonsecreted product within host Escherichia coli cells. The vaccine is used to protect against superantigen toxin infections. Superantigen attributes are absent, but the superantigen toxin infections is effectively recognised by the immune system and an appropriate antibody response is produced. In examples from the invention, attenuated superantigen toxins were shown to protect animals against challenge with wild-type toxin. Methods of producing and using the altered superantigen toxins as vaccines, and in diagnosis and therapy, are provided. A selb, sec. 1, TSST-1 and streptococcal SPEa is predicted to provide selb, sec. 1, TSST-1 and streptococcal SPEa is predicted to provide protective immunity against the majority of bacterial superantigen toxins
                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or I cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121

```
The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MMC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cuperantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin peptide, diagnosing superantigen toxin for producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, of a mammal against superantigen-associated bacterial infection, an antisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1. The superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin bNA fragment is useful for preparing and SPED). The superantigen toxin DNA fragment is useful for preparing and SPED). The superantigen toxin DNA fragment is a seful of or preparing and SPED).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQR 181

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention provides a superantigen toxin DNA fragment which has been genetically altered such that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is disrupted or altered. DNA fragments of the invention are useful in the production of vaccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the

The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or bomologue frase fragment protein comprising the SAg or its fragment or selected from Staphylococcal enterotoxin. A Streptcoccal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, pericardial effusion or meningal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin A (SEA) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating a subject with cancer or malignant diseases comprises intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or Leal antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating superantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host calls are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the staphylococcus enterotoxin A K14E mutant. Note: The present sequence is not present in the specification but was created by the indexer from the wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EKSEEINEKDLREKSELQGTALGNIKQIYYYNEKAKTENKESHDQFRQHTILFKGFFTDH

New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial
EEKKVPINLWIDGKOTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompacibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating superantigen associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the staphylococcus enterotoxin A Y64A mutant. Note: The present sequence is not present in the specification but was created by the indexer from the wild-type
                                                               Enterotoxin A; superantigen-associated bacterial infection; mutant; superantigen toxin; vaccine; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present amino acid sequence is the Staphylococcal enterotoxin A (SEA), a bacterial superantigen toxin (SAg). The coding region of the SAg toxin when altered by slite directed mutagenesis, results in disruption of binding of the toxin to both the MHC class II or T-cell antigen receptor. SEA has antibacterial and cytostatic activity. This sequence is useful
                                                                                                       121

                                                                                                                                                                                                                                                                                                                                                                                                                                             enterotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                              The present amino acid sequence is the mutant Staphylococcal enterotoxin A (SEA), a bacterial superantigen toxin (SAg), used for the formulation of SEA vaccine A498270P. The coding region of this SAg toxin is altered by site directed mutagenesis, that results in disruption of binding of the toxin to both the MHC class II or T-cell antigen receptor. This altered SAg toxin has the leader peptide cleaved by native bacterial enzymatic mechanism and the first residue of the mature protein is encoded by the transcriptional start site (ATG). SEA has antibacterial and cytostatic activity. This sequence is useful for the production of SEA vaccines and specific antibodies. This vaccine overcomes the disadvantages of the chemically inactivated toxoids and is designed to protect individuals against one or several related staphylococcal and streptococcal toxins. It is used for the diagnosis and treatment or

The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fusion protein comprising the SAg or its fragment or homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, pericardial effusion or meningeal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin J (SEJ) superantigen.
                                                                                                                                                                                                                                                    Treating a subject with cancer or malignant diseases comprises intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.
                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 12; 91pp; English

A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English.

The invention relates to a mammalian cell receptor, useful in the creatment of cancer, which binds to tumour associated lipids and induces an arguer of cancer, which binds to tumour associated lipids and induces canery or apoptosis in the T cells and antigan presenting cells (APCe). Ago included are a mammalian cell useful in the treatment of cancer where the receptors which binds thours associated lipids and induces cellular inactivation or death is deleted or functionally deactivated composition as for immunosupersessive fatty acids, ceramides, juylycolphids, sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosids, sphingolipids, glycosphingolipids and proteogytoclipids are inactivated or caleted), a construct useful in the treatment of cancer comprising a subjace fatty acids, ceramides, juylycolphingolipids, useful in the treatment of cancer comprising a caleted in the treatment of cancer (where an adaptor protein which inhibits T cell activation by tumour associated antigens is deleted or inhibits T cell activated), a composition useful in the treatment of cancer (where an adaptor protein which inhibits T cell activated), a composition was sociated lipid and the contact immunocyte population, and administering the tumouricidal immunocyte population, and administering the tumouricidal population, and administering the tumouricidal lipids are inactivated or deleted to produce a tumouricidal induced injude to contact produce a superantigen, to the host), producing (M) a tumouricidal lipid activated or deleted to produce a tumouricidal population, and administering the tumour associated lipids to contact paces, in which receptors for the thour associated lipids to contact call which adaptor proteins, and administering the tumouricidal population of contact calls in which adaptor proteins, and administering the tumouricidal population of contact minutoward call by administering a tumouricidal population in vivo in a mammal (My) administering the tumouricidal population in vivo in a mammal or contact stanhylococcal enterotoxin). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet office website at "seqdata.uspto.gov/sequence.html?DocID=20020177551" sequence represents a bacterial superantigen protein (e.g.

The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This is the amino acid sequence of an enterotoxin superantisen polypeptide the DNA encoding which can be transfected in to a cell alone or with DNA encoding a cell surface moiety to generate antitumour immunity.

selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, pericardial effusion or meningeal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin D (SED) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating a subject with cancer or malignant diseases comprises intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fusion protein comprising the SAg or its fragment homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic

These SEB, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rumor cell capable of stimulating antitumor immune reactivity in vitro or
in vivo comprises exogenous nucleic acids encoding a superantigen and a
costimulatory molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVP 126

equence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal enterotoxins (see ABB76214-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic excetoxins, with statistically significant sequence homology and similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with come or more superantigens ex vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction

Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibody moiety, such as tumour reactive antibody 574. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating superantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the superantigens to MHC class II or T-cell antigen receptors. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial

```

```
fragment is altered so that binding of the encoded altered toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHZ class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin peptide, diagnosing superantigen-associated bacterial infection, an infection, a vaccine (comprising an altered superantigen toxin for producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an treating/ameliorating a superantigen-associated bacterial infection, and treating/ameliorating a superantigen-associated bacterial infection, and anithody which recognises altered TSST-1. Superantigen toxin and an antibody which recognises altered TSST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, C1 (SEA, SEB). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the S. aureus enterotoxin B, SEB, MHC binding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     43 SDDQFLENTLLFKGFFTGHPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPN 102

fragment is altered so that binding of the encoded altered toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or Teall antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, peptide, diagnosing superantigen-associated bacterial infection, a vaccine (comprising an altered superantigen toxin peptide, diagnosing superantigen toxin for producing antigent cond immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an example required from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises and series of SEB). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the S. aureus enterotoxin A, SEA, MHC binding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   43 SDDQFLENTLLFKGFFTGHPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPN 102

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating euperantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the bacterial superantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    43 SDDQFLENTLLFKGFFTGHPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPN 102

Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           70 DLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVPINL 129
                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the protein sequence of staphylococcal entertoxin D (SED). The invention provides movel conjugates (see ABPS454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABPS455), and an antibody moiety, such as tumour reactive antibody 574. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)

The polypeptide, and polymcideotide encoding it, are derived from Staphylococcus aureus. Cells expressing ligands binding the polypeptide can be used to isolated candidate compounds that bind and inhibit the activity of the polypeptide. Such compounds can be used as anti-bacterial compounds. The polypeptide may also be used as an immunogen to vaccinate an animal for protection against Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MYGGVTLHDNNRLTEEKKVPINLWLDGKXNTVPLETVKTNKKONVTVQELDLQARRYLQEK 60

homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfixingens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, perioardial effusion or meningeal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin H (SEH) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         70 DLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEBKKVPINL 129

The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fusion protein comprising the SAg or its fragment or homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, perioardial effusion or meningal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin I (SEI) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEBKKVPINLWIDGKQTTV 138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                      The invention relates to treating a subject with cancer. The method cinvolves administering an amount of a superantisen (SAG) composition comprising a molecule selected from: a native SAG protein; its biologically active fragment or a biologically active fragment or a biologically active fragment or biologically active fusion protein comprising the SAG or its fragment or homologue tused to a fusion partner polypeptide or peptide. The SAG is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAG, Mycoplasma arthritides SAG and clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, perioardial effusion or meningeal carcinomatosis. The present sequence
                                                                                                                                                                                                                                                                                Treating a subject with cancer or malignant diseases comprises intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           80 YKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVPINLWIDGKQTTVP 139

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenes), comprising one of 5483 sequences (S1), given in the gpecification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I), may be used to treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            134 ---KQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLY------NSDSFGGKVQR 181

```
The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fragment or a biologically active fragment or proposition or peptide. The SAg is homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, pericardial effusion or meningeal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin M (SEM) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        83 KKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVPINLWIDGKQTTVPIDK 142

The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fragment or a biologically active fragment or protein comprising the SAg or its fragment or homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites, pericardial effusion or meningeal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin G (SEG) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    81 KGK-----KVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVPINLWIDGKQ 135

The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAG) composition comprising a molecule selected from: a native SAG protein; its biologically active fragment or a biologically active homologue or a biologically active fragment or a biologically active fragment or bonologue tused to a fusion protein comprising the SAG or its fragment or homologue fused to a fusion partner polypeptide or peptide. The SAG is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exocoxin, Y. pseudotuberculosis SAG, Mycoplasma arthritides SAG and clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, accites, pericardial effusion or meningeal carcinomatosis. The present sequence
                                     Treating a subject with cancer or malignant diseases comprises intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCS).

Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (ML) a tumouricidal immunocyte oppulation in vivo in a mammal (by allowing tumour associated lipids to contact immunocytes in which cereptors for immunosupressive fatty acids, ceramides, glycolipids, sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosides, shalylated glycans, lipopeptides and proceeglycolipids, gangliosides, sialylated glycans, lipopeptides and proceeglycolipids are inactivated cleted), a construct useful in the treatment of cancer comprising a superantigen (SAG) nuclectide inserted into a virus, a mammalian T cell useful in the treatment of cancer (where an adaptor protein which the treatment of cancer (where an adaptor protein which the inhibite T cell activation by tumour associated antigens is deleted or the interface or the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contac

The receptors, methods and compositions are useful for treating cancers and tumours. Bacterial superantigens are co-administered or administered as fusion constructs with anti-tumour proteins or motifs. The present

Staphylococcus aureus enterotocin B (EBB) protein. These peptides are capable of binding to immunoglobulin (1g) E antibodies. However, unlike SEB, they do not induce proliferation of T cells. The peptides are useful as immunomodulators and inhibitors of exterior production in T cells, particularly for treatment of atopic eczema, bronchial asthma, allergic rhinoconjunctivitis, psoriasis, rheumatoid arthritis and multiple sclerosis and for inducing or strengthening the Thi/Th2 immune responses, specifically for treating psoriasis, autoimmune uveitis, allergic contact eczema, Behcet's syndrome, diabetes mellitus, Hashimoto's thyroiditis, infection by Helicobacter pylori, lupus erythematosus, Crohn's disease, multiple sclerosis, organ transplant rejection, rheumatoid arthritis and spontaneous, recurrent abortion. They can also be used, in vitro, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          171 NSDSFGGKVQRGLIVFHSSEGSTVSYDLFDAQGQYPD--TLLRIYRDNKTINSENLHIDL 228

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This is the amino acid sequence of an enterotoxin superantigen polypeptide the DNA encoding which can be transfected in to a cell alone or with DNA encoding a cell surface moiety to generate antitumour immunity.

Nucleic acids encoding superantigens (see also AAW06738-39), esp. truncated forms of the superantigen lacking the leader peptide, can be utilised in the gene therapy of cancer, infectious diseases and immunological disorders. The nucleic acid, optionally in combination with cytokine or chemokine nucleic acids, is delivered to an animal using e.g. Tiposomes. It acts by controlling the activity of effector cells, such as T-cells, macrophages, monocytes and/or natural killer cells. Localised prodn. of an effective but non-toxic amount of encoded proteins allows

The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active fragment or a biologically active fragment or a biologically active fragment or biologically active fusion protein comprising the SAg or its fragment or homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringene exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion, ascites,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW64636-W64657 are peptides homologous to the amino acid sequence of a fragment of a pyrogenic exotoxin (PET), and derivatives of the peptide capable of eliciting protective immunity against toxic shock induced by PET or by a mixture of PETS. Such peptides are also capable of antagonising toxin-mediated activation of T-cells, inhibiting expression of pyrogenic toxin (PT)-induced mRNA encoded by ILL-2, IRN-gamma or INF-beta genes. The peptides may be used to prepare therapeutics or vaccines for the treatment of prophylaxis of toxin-mediated activation of T cells and eliciting protective immunity against toxic shock induced by PETS. They can also be used for the treatment of harmful effects (especially food poisoning) and toxic shock caused by PET. Antiserum to the peptides can also be used for alleviating toxic shock induced by PET
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61

antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo

The present invention relates to novel peptides derived from Staphylococcus aureus enterotoxin B (SEB) protein. These peptides are capable of binding to immunoglobulin (19) E antibodies. However, unlike SEB, they do not induce proliferation of T cells. The peptides are useful as immunomodulators and inhibitors of cytokine production in T cells, particularly for treatment of atopic eczema, bronchial asthma, allergic sclerosis and for inducing or strengthening the Thi/Th2 immune responses, specifically for treating psoriasis, autoimmune uveitis, allergic contact eczema, Behcet's syndrome, diabetes mellitus, Hashimoto's thyroiditis,
                                                                   111

                                                                                                                                                                                                                                                                                                                                      28
                                                                                                                                                                                                                                                                                                    61
epitopes derived from SEB that can be modified in order to create variants that are non-immunogenic. The present invention describes designing SEB analogues containing amino acid substitutions in the most immunogenic regions. Accordingly, the resulting modified molecules are useful as determinants on SEB able to evoke an immune response. This polypeptide sequence is the Staphylococcus aureus enterotoxin B protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        streptococcal toxic shock syndrome; STSS; symptom; amelioration; fever; hypotension; group A streptococcal infection; myositis; fascitis; liver damage; T cell; lymphoma; ovarian; uterine.

The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to ceither the MHC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, peptide, diagnosing superantigen toxin peptide, diagnosing superantigen toxin peptide, diagnosing superantigen toxin peptide, diagnosing superantigen toxin for producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an antiser a isolated from individuals immunised with one or more altered to treating/ameliorating a superantigen-associated bacterial infection, an antised and surpercoccal pyrogenic enterotoxin A, B, Cl (SEA, CT SSE). The superantigen toxin and an antibody which recognises altered TSST-CT superantigen toxin and an antibody which recognises altered TSST-CT SSEB, SECI) and streptococcal pyrogenic enterotoxin A, B, Cl (SEA, CSEB, SECI) and streptococcal pyrogenic enterotoxin A, B, Cl (SEA, CSEB, SECI) and streptococcal pyrogenic enterotoxin A, B, Cl (SEA, CSEB, SECI) and streptococcal pyrogenic enterotoxin A, B, Cl (SEA, SEB). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence mutant of SEB. Note: The present sequence is not shown in the specification but was created by the indexer using the wild-type sequence of the information in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 111 VTLHDNNRLTEEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLY 170
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 SEKSEEINEKDLRKKSELQRNALSNLRQIYYYNEKAITENKESDDQFLENTLLFKGFFTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                          The present sequence is a non-lethal Streptococcus pyogenes Streptococcal toxin A (SBE-A) mutant, which can be used to produce vaccines to protect animals against wild type SPE-A and to treat cancer and streptococcal toxic shock syndrome (STSS). The mutant SPE-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms, e.g. fever, hypotension, group A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPE-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPE-A can be selectively toxic to T cell lymphoma cells. N.B. Sequence not given in the specification, but constructed using the wild type SPE-A sequence given on pages 77-79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQC-AGGTPNKTACMYGGVTLHDNNRL 119

                                                                                                                                                                                                                                                                                                         SPE A can be used for tumouricidal treatment, esp. with a haemolysin. Synthetic polypeptides having structural homology to Streptococcal pyrogenic exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. See AAR13203-R13211. (Updated on 27-AUG-2003 to correct OS field.)

These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the protein A perfusion system. They may be administered by i.v. injection. ```

```
The present sequence is a non-lethal Streptococcus pyogenes Streptococcal animals against which can be used to produce vaccines to protect animals against wild type SPE-A and to treat cancer and streptococcal toxic shock syndrome (STSS). The mutant SPE-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms, e.g. fever, hypotension, group A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPE-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPE-A can be selectively toxic to T cell lymphoma cells. N.B. Sequence not given in the sepecification, but constructed using the wild type SPE-A sequence given on pages 77-79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYY---GYQCAGGTPNKTACMYGGVTLHDNN 117

The mutant SPB-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms, e.g. fever, hypotension, group A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPB-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPB-A can be selectively toxic to T cell lymphoma cells. N.B. Sequence not given in the specification, but constructed using the wild type SPB-A sequence given on pages 77-79

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg profesh; its biologically active fragment or a biologically active homologue or a biologically active fusion protein comprising the SAg or its fragment o homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancor malignant diseases such as malignant pleural effusion, ascites, perioardial effusion or meningeal carcinomatosis. The present sequence represents a Streptococcal pyrogenic exotoxin A (SpEA).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a non-lethal Streptococcus pyogenes Streptococcal toxin A (SPE-A) mutant, which can be used to produce vaccines to protect animals against wild type SPE-A and to treat cancer and streptococcal toxic shock syndrome (STSS). The mutant SPE-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms, e.g. fever, hypotension, group A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPE-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPE-A can be selectively toxic to T cell lymphoma cells. N.B. Sequence not given in the specification, but constructed using the wild type SPE-A sequence given on pages 77-79

                                                                                                                                                                                                                                                                                                                                                                                                   toxic shock syndrome (STSS). The mutant SPE-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms. e.g. fever, hypotension, group A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPE-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPE-A is be selectively toxic to T cell lymphoma cells. N.B. Sequence not given in the specification, but constructed using the wild type SPE-A sequence given on pages 77-79

The mutant SPE-A can be used to produce vaccines to protect animals against wild type SPE-A and to treat cancer and streptococcal toxic shock syndrome (STSS). The mutant SPE-A causes neutralising antibodies (Ab) to be produced, which may be used to mentralising antibodies (Ab) to be produced, which may be used to infection, myositis, fascitis and liver damage. The neutralising A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPE-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPE-A can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              81

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                 The present sequence is a non-lethal Streptococcus pyogenes Streptococcal toxin A (SPE-A) mutant, which can be used to produce vaccines to protect animals against wild type SPE-A and to treat cancer and streptococcal toxic shock syndrome (STSS). The mutant SPE-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms, e.g. fever, hypotension, group A streptococcal infection, myositis, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPE-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPE-A is especially useful toxic will specially useful toxic neutral special calls. N.B. Sequence not given in the specification, but constructed using the wild type SPE-A sequence given on pages 77-79

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          toxin A (SPB-A) mutant, which can be used to produce vaccines to protect animals against wild type SPB-A and to treat cancer and streptococcal toxic shock syndrome (STS). The mutant SPB-A causes neutralising antibodies (Ab) to be produced, which may be used to ameliorate STSS symptoms, e.g. fever, hypotension, group A streptococcal infection, amositie, fascitis and liver damage. The neutralising Ab is preferably administered in conjunction with antibiotic therapy. The mutant SPB-A is especially useful for treating T cell lymphomas, and ovarian and uterine cancer. It is thought that mutant SPB-A can be selectively toxic to T cell lymphoma cells. N.B. Sequence not given in the specification, but constructed using the wild type SPB-A sequence given on pages 77-79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present sequence is a non-lethal Streptococcus pyogenes Streptococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant SPE-A toxin with at least one amino acid change is substantially non-lethal - used in vaccine composition for treatment of cancer and streptococcal toxic shock syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               : | | | ::| | | ::| | STGYIKEIPKONKESFWFDFFPBPFFTQSXY----LMIYKONFTLDSNTSQIEVYLIT 250

This is the amino acid sequence of the Streptococcus pyogenes exotoxin A (SPE-A toxin). The novel mutant Streptococcal SPE-A toxin has at least 1 as change and is nonlethal compared with a protein to wild type SPE-A toxin. The mutant SPE-A toxins are nontoxic and can produce antibodies that neutralise wild type SPE-A toxin activity. The toxins can be used in vaccines and therapeutics to generate a protective immune response against streptococcal infection. The used to protect against the development of streptococcal toxic shock syndrome (STSS). In addition, the toxins can be used for treating animals with symptoms of streptococcal infection nor STSS and in methods for stimulating T cell proliferation and in the treatment of cancer. In particular they can be used for treating T call lymphomas, and ovarian and uterine cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQC-AGGTPNKTACMYGGVTLHDNNRL 119

This protein represents the Staphylococcus aureus type C enterotoxin SEC3-FR1909. The invention relates to pyrogenic toxins, such as staphylococcal enterotoxins, modified in the disulfide loop region. Typically, the modification involves deletions within the disulfide loop region of SEC (see AAv66261). The modified toxins retain useful biological properties, such as the ability to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Emetic response inducing activity and fever inducing activity are typically decreased by at least about 100-fold, while LD50 (in Dutch Belted rabbits) is at least 100-fold higher than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        --KKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ĕ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a modified pyrogenic toxin derived from a native disulphide loop-containing pyrogenic toxin where the modified toxin comprises a disulphide loop having no more than 10 amino acids. The modified toxin has a fever-inducing activity or an emetic response-inducing activity decreased by about 100-fold in comparison to a native toxin. The modified pyrogenic toxin, that is a staphylococcal enterotoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and food poisoning. This sequence represents the staphylococcal enterotoxin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New modified staphylococcal enterotoxin derived from a native disulfide loop-containing pyrogenic toxin, useful for non-specifically enhancing an immune function and as a vaccine against toxic shock syndrome or food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the protein sequence of staphylococcal enterotoxin B (SEB) vaccine B42360210. The invention relates to a vaccine against superantigen toxin-associated bacterial diseases. Superantigen vaccines were developed by engineering changes in the receptor-binding portions of superantigen toxins such as SEB to reduce receptor-binding affinities and toxicity while maintaining antigenicity. In examples from the invention, attenuated superantigen toxins were shown to protect animals against challenge with wild-type toxin. Methods of producing and using the altered superantigen toxins as vaccines, and in diagnosis and therapy, are provided. A multivalent vaccine consisting of altered superantigen toxins SEC-1, TSST-1 and streptococcal SPEa is predicted to provide protective immunity against the majority of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated and purified superantigen toxin DNA fragment which has been genetically altered, useful for producing vaccine for treatment of superantigen toxin-associated bacterial diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 SEKSEEINEKDLRKKSELQRNALSNLRQIYYYNEKAITENKESDDQFLENTLLFKGFFTG

fragment is altered so that binding of the encoded altered toxin to either the MHC class II or I cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) infection, a vaccine (comprising an altered auperantigen toxin for producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    :| :| ||| |:: | 37 AESQPDPKPDELHKSSKF--TGLMEDMKVLYDDNHVSAINVKSIDQFLYFDLIYSIXDTK 84

Also disclosed are mutated staphylococcal enterotoxin A, B, CI (SEA, SEB, SECI) and streptococcal pyrogenic enterotoxin a and b (SFBa and composition for treating or preventing bacterial infection. The presents sequence represents wild-type SEB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated and purified superantigen toxin DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 SEKSEEINEKDIRKKSELQRNALSNIRQIYYYNEKAITENKESDDOFLENTLLFKGFFTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating particularly useful for producing vaccine against superantigen toxins, particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQC-----AGGTPNKTACMYGG 110

The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tumor cell capable of stimulating antitumor immune reactivity in vitro or in vivo comprises exogenous nucleic acids encoding a superantigen and a costimulatory molecule.

DNA fragments of the invention are useful in the production of waccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SE8) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein or system. They may be administered by i.v. injection. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           112 TLHDNNRLTEEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYN 171

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEB. Synthetic polypeptides having structural homology to Staphylococal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. See AAR13203-R13211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 58
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           was isolated and purified from S.aureus. It can be used for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 EKSEBINEKOLRKKSELORNALSNIROIYYYNEKAITENKESDDOFLENTLIFKGPFTGH
